just browsing
content without
watching
anything

WHAT IS THE PROBLEM

Many users spend several minutes scrolling through catalogs, and sometimes they spend so much time deciding that they end up watching nothing at all.

WHAT IS THE SOLUTION

GAAS, a decision engine that helps people choose what to watch, play or listen right now

Application Advantages

01

GAAS focuses on the present moment, helping users quickly decide what to watch right now instead of saving endless recommendations for later.

02

Instead of scrolling through hundreds of titles, users receive a few curated options in minutes, making the decision process fast and simple.

03

Through quick swipes and AI interaction, the app adapts to the user's current mood and preferences in that specific moment.

04

With Group Match, friends can join the same session, swipe together and quickly find a movie or series that works for everyone.

05

GAAS reduces decision fatigue by limiting choices and guiding users toward a clear final decision.

06

Once the match is found, users can immediately see where the content is available and go directly to the streaming platform.

THE GAAS EXPERIENCE

HOW IT WORKS?

01

When users enter GAAS, the first thing they do is interact with the chatbot. Here they can express what they feel like doing in that moment, for example what they want to watch, their mood, or how much time they have. This conversation helps the system understand the user's preferences before starting the discovery process.

02

After that, users begin the swipe phase. They scroll through different pieces of content and quickly react to them: swiping right if they like it, left if they don't, or up if they have already seen it. This fast interaction allows GAAS to understand the user's taste in real time and build a much more accurate recommendation.

03

Once the system has collected enough information, GAAS analyzes the data and presents a small number of final alternatives. Instead of scrolling endlessly through hundreds of titles, users receive three curated options with a compatibility score, making the decision quick and simple.

THE MATCH MOMENT

SHARE

Once a match is found, users can easily share the result with their friends. With the share button, they can post the content directly on social media or send it through messaging apps, making it simple to show what they are about to watch or recommend it to others.

WHERE?

The “Where to Watch” button shows all the platforms where the content is available, such as Netflix, Prime Video or other streaming services. This allows users to immediately see where they can watch it and move directly to the platform without having to search for it elsewhere.

OTHER FEATURES

01

COMMUNITY DISCOVERY

02

GROUP MATCH

03

PROFILE & RANKING

COMMUNITY DISCOVERY

GAAS also includes a community discovery page where users can explore trending content and see what others are watching. The “For You” feed shows recommendations from the community, allowing users to like, comment and interact with different posts, creating a shared space for discovering new movies, series and other content.

GROUP MATCH

With Group Match, users can invite their friends to join a session and decide together what to watch. Both users can ask the AI for suggestions and start swiping through different options. After a few swipes, GAAS analyzes the preferences of everyone in the session and proposes a final match that works for the whole group.

PROFILE & RANKING

Each user has a personal profile where they can track their activity, badges and matches over time. The profile also includes a friends leaderboard, allowing users to compare their progress and rankings with others, making the experience more social and engaging.

WHATS NEXT?

01

The app can generate revenue through affiliate links with streaming platforms, earning a commission when users access content through GAAS.

02

GAAS will introduce a premium plan that unlocks advanced features such as unlimited swipes, deeper AI recommendations, and enhanced personalization.

03

Streaming platforms and studios could promote specific movies or series within the app, appearing as sponsored recommendations.

04

Future updates will include enhanced group experiences, watch parties, and deeper social interaction between users.
